ISCHEMIA-CKD QoL Research Question

In a stable patient with advanced CKD and at least moderate ischemia, does an invasive strategy **improve patients' health status (symptoms, function and quality of life)?**

Study Design

Brief QoL Assessment

Brief QoL Assessment:

- Seattle Angina Questionnaire – 7
 - Angina Frequency**
 - Quality of Life**
 - Physical Limitations

SAQ Summary Score*

	1.5m	3m	6m	12m	18m	24m	30m	36m
Con:	92%	90%	91%	89%	90%	87%	85%	88%
Inv:	88%	85%	90%	85%	87%	86%	82%	80%

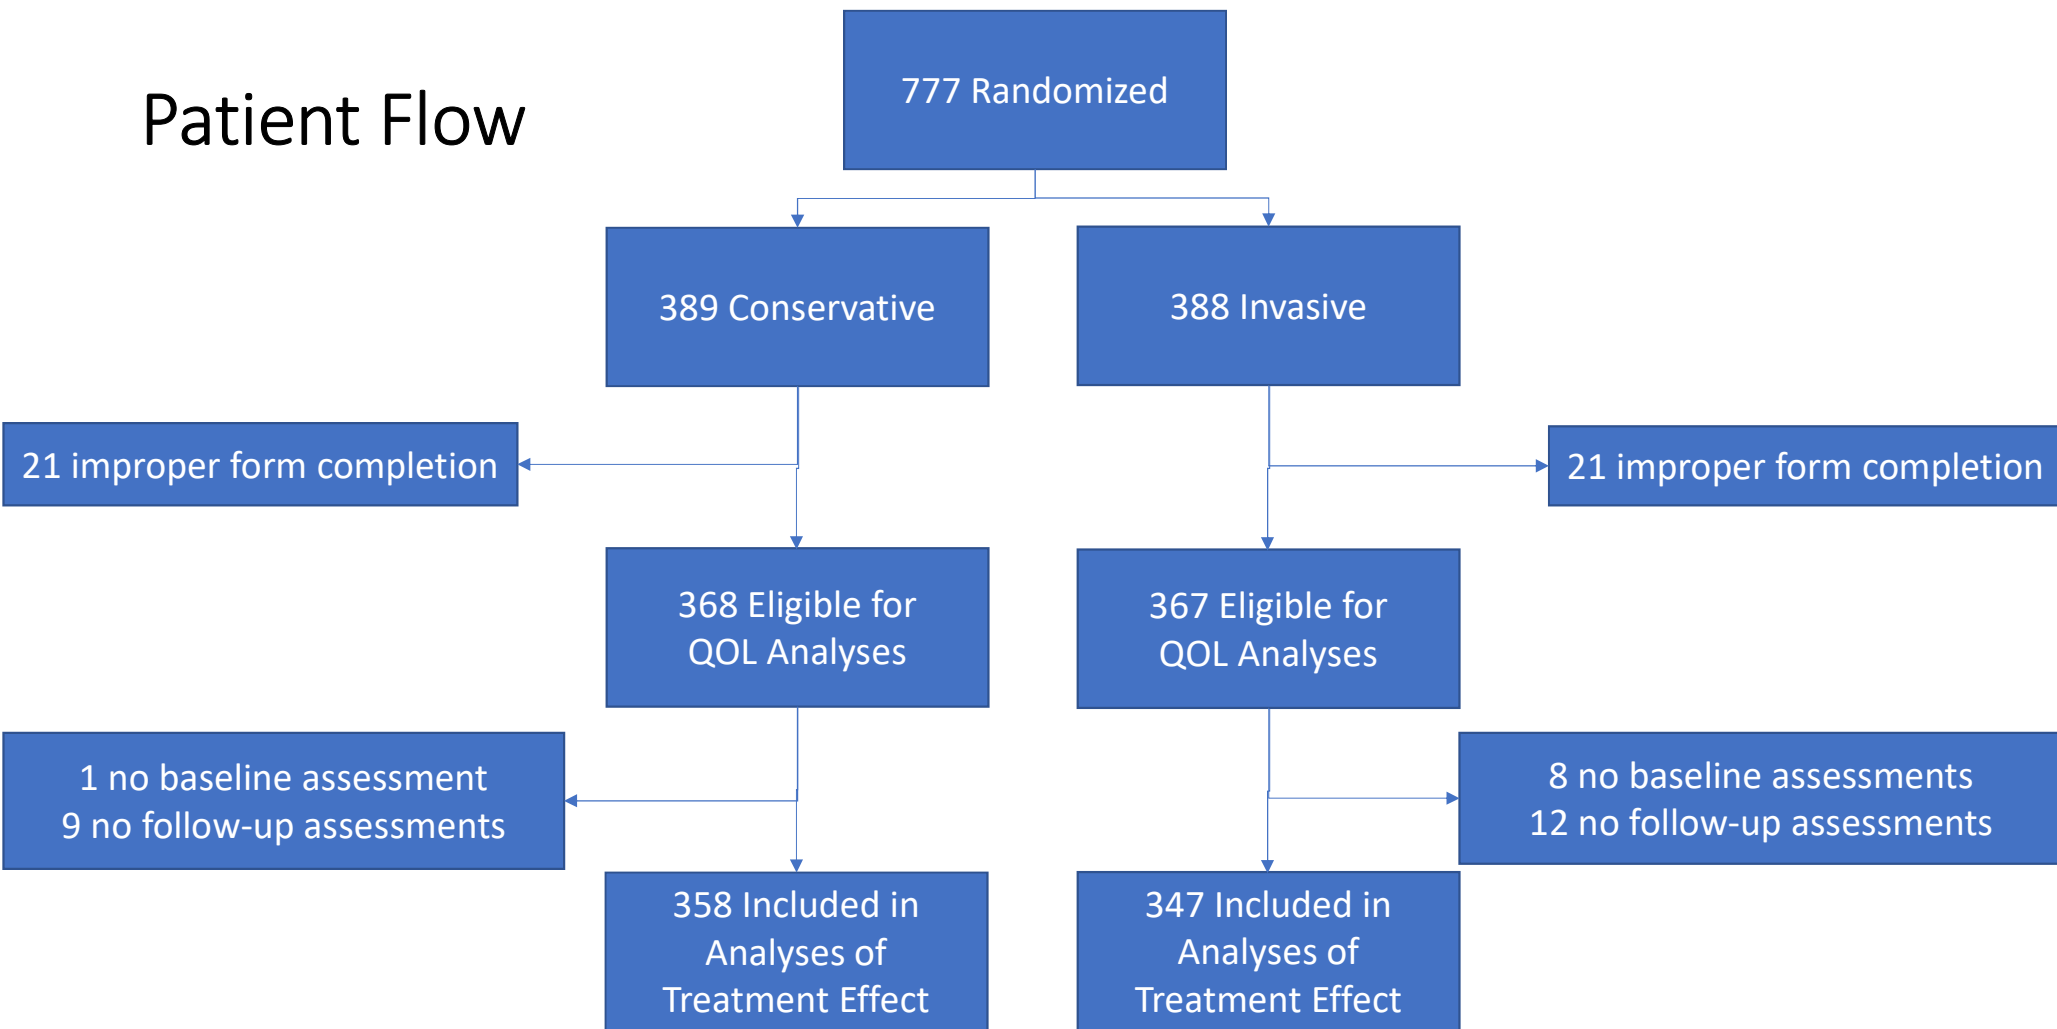

*Primary QoL Outcome
 **Secondary QoL Outcome

Statistical Methods

- Simple descriptive statistics of observed mean scores
- Mixed-effect proportional odds models for all QOL scales
 - Treatment effect = Odds ratio for $QOL \geq X$, at each time point
 - Results transformed to individual SAQ scales
- Bayesian methods used for all models to directly estimate probability of treatment effect with posterior means and 95% posterior density intervals
 - Joint models to account for drop-outs due to death as a secondary analysis
- Analyses performed for all patients and stratified by baseline angina
 - e.g. daily/weekly vs. several times per month vs. no angina

Patient Flow

Baseline Health Status

Scale	Invasive	Conservative
SAQ Summary Score	75.7±20	76.0±19
SAQ Quality of Life Score	65.3±28	66.2±27
SAQ Angina Frequency Score	86.7±18	86.9±18
Daily/Weekly Angina	11.9%	11.7%
Several Times per Month	38.2%	40.2%
No Angina	50.0%	48.0%

Probability Distribution of Treatment Benefit from Bayesian Analyses

All Patients

**95% Highest Posterior Density Interval*

Probability Distribution of Treatment Benefit on SAQ Summary Score

Daily/Weekly Angina

**95% Highest Posterior Density Interval*

Probability Distribution of Treatment Benefit on SAQ Summary Score

At Least Monthly Angina

**95% Highest Posterior Density Interval*

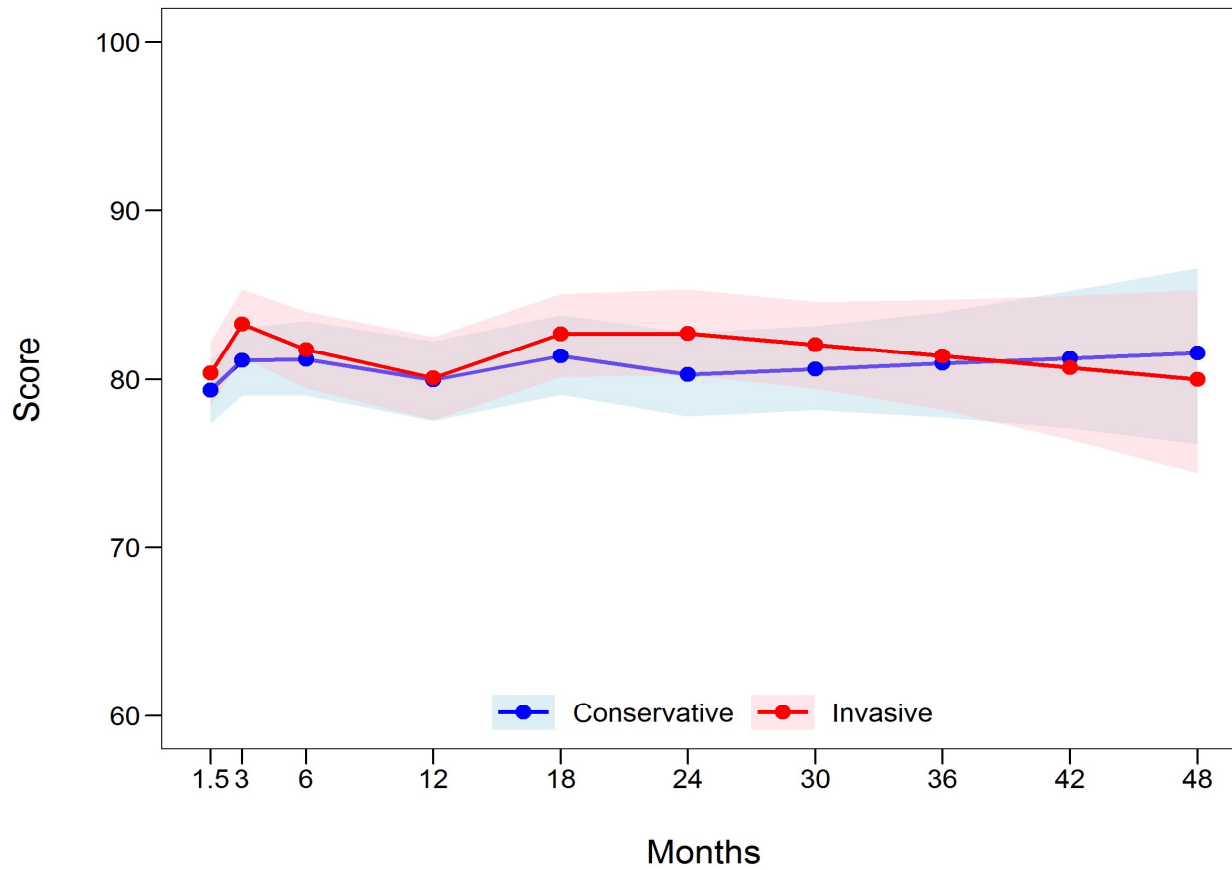

Probability Distribution of Treatment Benefit on SAQ Summary Score

No Angina

*95% Highest Posterior Density Interval

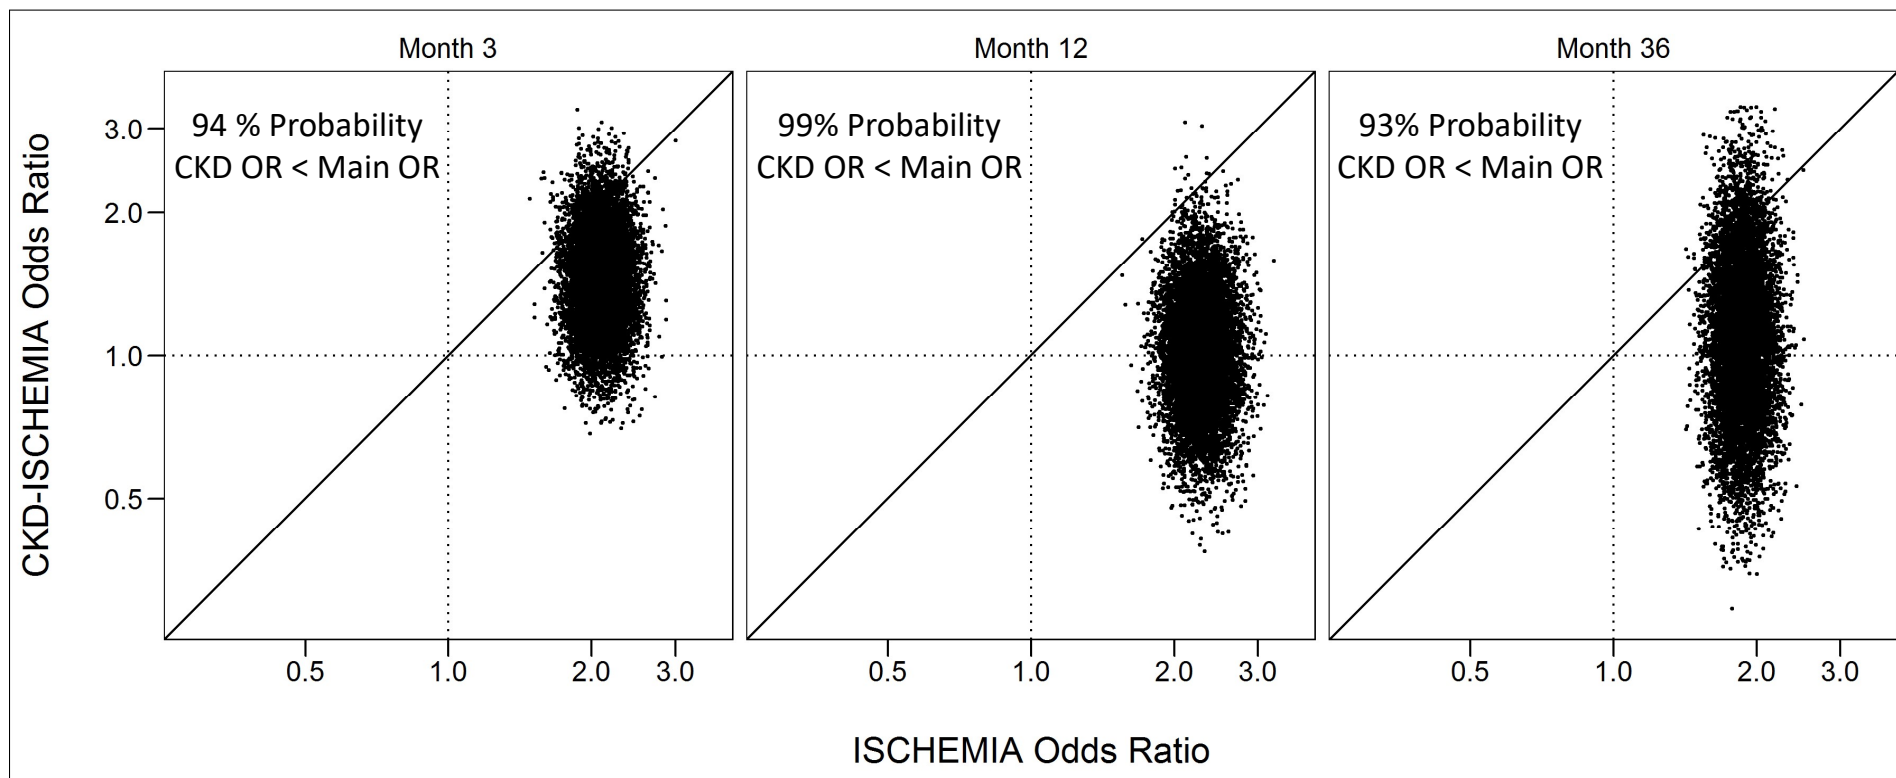

Predicted Means of SAQ SS with Joint Models

SAQ-7 Summary Score Odds Ratios

Month	Odds Ratios (95% CrIs)	Probability (%) of Any Benefit
1.5	1.20 (0.76, 1.66)	81%
3	1.48 (0.90, 2.16)	95%
6	1.13 (0.61, 1.69)	65%
12	1.06 (0.55, 1.62)	53%
24	1.59 (0.77, 2.49)	93%
36	1.16 (0.45, 2.03)	59%

Posterior Distribution of ORs for Main and CKD Trials

Limitations

- Missing SAQ data, although small (<15%)
- Very skewed enrollment towards less symptomatic patients; may not have been able to discern a QoL benefit in more symptomatic patients
- Large mortality rate, but little difference in joint models due to similar mortality in both arms

Conclusions

- In patients with stable CAD, advanced CKD and moderate to severe ischemia, we did not observe a substantial improvement in angina control and quality of life over time
- However, given the large proportion of asymptomatic patients at baseline, we cannot exclude the possibility of a small benefit in symptomatic patients
